

Nebraska
Certified Crop Adviser Program

Performance Objectives

Approved April 2016

**The Nebraska Certified Crop Adviser Board
Committee for Exams and Continuing Education
1111 Lincoln Mall, Suite 308
Lincoln, NE 68508
Phone: (402) 476-1528 | Fax: (402) 476-1259 | E-Mail: info@necca.org**

Introduction

Just as the International Certified Crop Adviser (CCA) Performance Objectives outline the knowledge and skill areas that advisers need in order to effectively meet their duties and responsibilities on the general scheme, the Nebraska CCA Performance Objectives have been developed to indicate the knowledge and skills needed to perform well in Nebraska's climate and cropping systems. These performance objectives are the heart of the CCA Program. They are used as the framework for test construction and the basis for continuing education programs. The Nebraska Certified Crop Advisers Board provides oversight and direction to the Committee for Exam and Continuing Education. The Board ensures that the Nebraska CCA Performance Objectives are reviewed and revised in a timely manner.

These performance objectives are dynamic. They are upgraded as needed, particularly as the technology of the crop production industry evolves. The upgrading is done by the Exam and Continuing Education Committee, which is a standing committee for the Nebraska Certified Crop Adviser Board. The upgrading process ensures that the CCA program will remain viable and useful, and that the program recognizes the high level of competency needed by individuals, who will advise producers now and in the future.

The Nebraska CCA Performance Objectives, as outlined in this document, delineate the knowledge and skills that are considered important for certified crop advisers working in Nebraska. Expertise in these areas is expected. All questions on the Nebraska CCA Exam are based on the Nebraska CCA Performance Objectives. Certified crop advisers must also demonstrate their expertise in International CCA Performance Objectives. The International CCA Exam questions are based on the International CCA Performance Objectives.

Since the International and Nebraska Performance Objectives are developed over the materials that Certified Crop Advisers need to know, it is apparent that they are the basis for the entire CCA program. The first step for persons interested in becoming a certified crop adviser is adequately mastering the material covered in the Performance Objectives, so one can pass the CCA exams (i.e. International and Nebraska). All the questions on both exams are based directly on these Performance Objectives.

The Performance Objectives serve as the guide for CCA continuing education, which is the backbone of the CCA program. Once certified, the CCA must participate in continuing education programs. These programs ensure that the CCA maintains or increases their proficiency, and maintains the integrity of the CCA program. Certified Crop Advisers should use these Performance Objectives to identify areas where they need to strengthen their proficiency.

Nutrient Management

Competency Area 1: Basic Concepts in Plant Nutrition

1. Understand the 4R concept and the four components (rate, time, source, application methods) that make up the 4Rs and how they relate to plant nutrition.
2. Identify plant species that fix gaseous nitrogen, describe the process involved in nitrogen fixation and identify limiting factors.
3. Describe how nutrient cycles and plant nutrient availability are impacted by management (tillage, cropping system, 4Rs etc.).
4. Understand how plants take up nutrients and the functions of various nutrients in the plant.

Competency Area 2: Basic Concepts in Soil Fertility

1. Describe transformations of soil and fertilizer nutrients, including nitrification, denitrification, volatilization, immobilization, mineralization, fixation, and dissolution.
2. Understand soil Macro-nutrients and micro-nutrients and their importance in soil fertility.
3. Identify soil conditions/quality factors that restrict or enhance nutrient availability to plants and propose ways to maintain or increase it.
4. Describe means by which nitrogen can be lost from the soil and propose methods to reduce the loss.
5. Describe the importance of soil organic matter; and soil physical, chemical and biological properties that are important to soil fertility.

Competency Area 3: Soil Testing and Plant Analysis

1. Describe the objectives and processes of soil testing and describe its applications to the growth of plants.
2. Understand soil testing used for site specific and management zone nutrient recommendations.
3. Provide instructions for taking good soil samples for nutrient analysis and fertilizer recommendations.
4. Understand the uses of plant tissue analysis and some of its limitations.

Competency Area 4: Nutrient Sources and Applications

1. Give the desired composition of starter fertilizers and identify situations where they should be used.
2. Perform computations which use rate of nutrient required to calculate rate of fertilizer recommended and vice versa.
3. Select suitable application methods for fertilizers considering soil and cropping conditions, and fertilizer characteristics.
4. Select common fertilizers to provide plant nutrients in selected soils and management systems.

5. Understand how application timing, form and amount of fertilizer, can limit the losses of mobile nutrients such as nitrogen while ensuring nutrients are available when the crop needs them.
6. Determine suitable application rates, methods of common manure/compost products.
7. Understand the use and availability/mineralization of nutrients from manure, irrigation water, legumes/cover crops and other nutrient sources and factors that impact nutrient recommendations.

Competency Area 5: Soil pH, Amendments & Salinity

1. Describe the concept of soil pH and identify ways to maintain, raise or lower it.
2. Describe saline and sodic soils, identify their cropping problems, and propose means for managing or adjusting their levels in soils.

Competency Area 6: Nutrient Management Planning

1. Relate ease of movement of nutrients through the soil to soil conditions and nutrient form, management practices (tillage, use of cover crops) and soil nutrient holding capacity.
2. Understand the use of organic materials as nutrient sources for plants considering their composition, carbon/nitrogen ratios, and method of application, mineralization rates, and uniformity of application, benefits, drawbacks, and other factors to optimize their use.
3. Define soil and plant conditions where sulfur, zinc and iron deficiency for plants may be a problem.
4. Describe the process and the products in the conversion of organic wastes into plant available nutrient forms.

SOIL AND WATER MANAGEMENT

SOIL MANAGEMENT

Competency Area 1: Basic Concepts in Biological Soil Properties

1. Define the soil food web.
2. Describe the importance of soil biological diversity.
3. Describe major functions of soil organisms.
4. Describe how tillage and crop rotations impact the soil food web.

Competency Area 2: Basic Concepts in Physical Soil Properties

1. List approximate available water holding capacity for common soil textural classes.
2. Describe the concepts of permanent wilting point, field capacity, and plant available water of soils.
3. Describe how tillage affects soil structure.
4. Describe how wetting/drying and freezing/thawing affects soil structure.
5. List key soil physical properties and how they impact water availability, infiltration, runoff, plant growth, and nutrient cycling.

Competency Area 3: Soil Management Measures

1. Describe the soil quality benefits and risks of livestock manure application.
2. Describe the benefits of soil health planning principles:
 - a. Keep the soil covered
 - b. Living plant root as much as possible
 - c. Limit disturbance
 - d. Crop Diversity
 - e. Integrate Livestock

Competency Area 4: Basic Concepts in Erosion Processes

1. Relate how the following conditions can affect the rate of erosion:
 - a. Soil moisture content
 - b. Surface crusting
 - c. Tillage (surface condition)
 - d. Standing crop residue
 - e. Flattened crop residue
 - f. Importance of Aggregate Stability

2. Explain how the following conservation practices affect sheet, rill, gully, and wind erosion:
 - a. Field Windbreaks
 - b. Stripcropping
 - c. Vegetative Barriers
 - d. Contour Farming
 - e. Terraces

Competency Area 5: Basic Concepts of Soil Tillage and Crop Residue Management

1. Describe how the following impact the amount of soil surface residue cover:
 - a. Crop rotation
 - b. Crop yield
 - c. Harvesting method
 - d. Tillage system
 - e. Fertilizer and manure application
 - f. Climate
 - g. Carbon to Nitrogen Ratio
2. Recognize the approximate residue reduction caused by common tillage practices.
3. Recognize the impact of various tillage practices and systems on:
 - a. Nutrient availability and fertilizer application
 - b. Pest management and herbicide applications
 - c. Soil moisture content and soil temperature
 - d. Crop development and weed control
 - e. Soil structure
 - f. Compaction
 - g. Aggregate Stability
4. Distinguish between clean till and high surface residue management systems regarding surface crusting, soil structure and aggregate stability.
5. Describe how tillage and soil surface residue cover affect soil moisture losses due to evaporation.

Competency Area 6: Basic Concepts of Restrictive Soil Layers

1. Explain how tillage can both create and reduce soil compaction.
2. Explain the use of cover crops and crop rotation to reduce compaction.

Competency Area 7: Basic Concepts of State and Federal Regulations and Policy

1. Recognize the intended environmental benefits of the Environmental Quality Incentives Program and other federal, state and local conservation programs.
2. Identify the general provisions of the Nebraska Erosion and Sediment Control Act.
3. Recognize the basic regulations dealing with ground water and surface water use in Nebraska.
4. Identify the basic Natural Resources District responsibilities.

Competency Area 8: Basic Concepts in Site Characterization

1. Recognize how site characteristics can affect potential ground water and surface water contamination.

2. Recognize how soil properties can affect potential ground water and surface water contamination.

WATER MANAGEMENT

Competency Area 1: Basic Concepts of Water and Contaminant Movement

1. Describe how the following factors affect infiltration and runoff:
 - a. Soil texture
 - b. Soil structure
 - c. Soil organic matter
 - d. Soil surface roughness
 - e. Soil surface residue
 - f. Bulk Density
 - g. Aggregate Stability
2. Describe the relationships among tillage, residue, surface crusting, soil structure, infiltration, runoff, aggregate stability and compaction.
3. Describe how the following may impact contaminant movement:
 - a. Precipitation and runoff characteristics
 - b. Contaminant degradation characteristics
 - c. Contaminant adsorption characteristics
 - d. Soil and site conditions
4. Describe how the vadose zone characteristics and depth to ground water may impact contaminant accumulation in ground water.

Competency Area 2: Basic Concepts in Soil, Plant & Water Relationship

1. List typical daily water use and total seasonal water requirements for major Nebraska crops.
2. Describe critical stages of crop growth for major Nebraska crops when adequate moisture is required.
3. List the minimum allowable soil water balance (or maximum allowable soil water depletion) to prevent crop water stress in Nebraska irrigated crops.
4. Describe factors that determine the amount of rainfall that will be available for crop use (effective rainfall).
5. Describe Best Management Practices (BMPs) to avoid groundwater contaminations from point and non-point sources.
6. Describe practices to conserve soil moisture available for crop use in dryland production settings.

Competency Area 3: Basic Concepts in Water Quality

1. Differentiate between and describe point and non-point sources of pollution. Explain the relationship between:
 - a. Parts per million
 - b. Parts per billion
 - c. Milligrams per liter
 - d. Micrograms per liter
2. Describe the significance of the following:
 - a. Maximum contaminant level
 - b. Maximum contaminant level goal
 - c. Secondary maximum contaminant level
 - d. Health advisory level
 - e. Total maximum daily load
3. Differentiate between chemical concentration and loading in surface water.
4. Select best management practices to reduce herbicides (especially atrazine) in surface water.
5. Select best management practices to reduce the potential for nitrate contamination of groundwater.

Competency Area 4: Basic Concepts of Irrigation Water Management

1. Calculate crop root zone soil water balance.
2. List common methods to measure soil moisture levels and tools used.
3. Define impact of weeds on soil moisture depletion.
4. Define impact of crop residue retention on soil moisture management.
5. Define ET and use in irrigation scheduling.
6. Determine amount of irrigation water applied with an irrigation event.
7. Describe the common methods of monitoring soil moisture status.
8. Describe the common procedures for scheduling irrigation.
9. Describe the basic procedures for scheduling the last irrigation of the season.
10. Calculate the number of days before the next irrigation is needed and the necessary irrigation amount.
11. List the factors that influence irrigation system application efficiency.
12. Describe the factors to consider when selecting and designing an irrigation system.
13. List the factors that impact the selection of sprinkler devices for center pivot systems.
14. Describe the principles of surge irrigation application.
15. Explain how to adjust irrigation schedules for electrical load management, system flow rates, and soil depth and texture.

16. Describe how slope, set size, furrow flow rate, set time, and soil texture can affect the uniform application of irrigation water and leaching potential along the length of the furrow with furrow irrigation.
17. Describe how furrow irrigation management changes depending on runoff control measures used (no runoff control in place, tailwater recovery system, blocked field ends).
18. Describe how the sprinkler package, soil texture, slope, surface storage, runoff, topography, and wind can affect the uniform application of irrigation water with center pivot irrigation.
19. Describe the factors that impact the scheduling of the first irrigation when using a center pivot.
20. Describe basics for sub-surface drip systems.
21. Understand benefits and challenges for use with drip/sub-surface irrigation systems.

Competency Area 5: Basic Concepts in Application of Fertilizers and Pesticides by Chemigation

1. List factors to consider when selecting materials to be applied by chemigation.
2. Identify the requirements of the Nebraska Chemigation Act including the requirements for installed safety devices.
3. Describe how to evaluate a field site for environmental impacts of using chemigation as a means of chemical application.
4. Select the equipment best suited for chemigation application of fertilizers and pesticides.
5. Identify the proper procedures for calibrating a chemigation and irrigation system for chemigation purposes.
6. Describe the appropriate mixing and cleanup procedures for fertilizers and pesticides applied via chemigation.
7. List the specific requirements for backflow safety when manure storage or lagoon contents are mixed with irrigation water.

Competency Area 6: Basic Concepts in Livestock Environmental Issues

1. Recognize potential soil and water contaminants in manure (nitrogen, phosphorus, pathogens, salts, and organic matter) and identify:
 - a. Environmental impact of contaminants
 - b. Pathways for movement to surface and ground water
 - c. Management principles for minimizing risk to the environment
2. Describe the concept of whole farm nutrient management as it applies to integrated livestock/crop operation and:
 - a. Distinguish farms with significant imbalance (accumulation) of nutrients
 - b. Distinguish primary sources of excess nutrients
 - c. Choose strategies that improve the nutrient balance
 - d. Select management practices that reduce the quantity of nutrients in manure

3. Prepare nutrient management plans for manure and other organic nutrient sources that:
 - a. Identify land requirements based upon livestock capacity and feeding program choices
 - b. Determine the quantity of manure in an overall crop nutrient program
 - c. Accurately credit these nutrients in an overall crop nutrient program
 - d. Minimize the accumulation of phosphorous in the soil
 - e. Provide tools for in-season monitoring of crop nitrogen status
 - f. Provide appropriate record keeping tools
4. Formulate a process for prioritizing fields to receive manure and timing of applications that consider:
 - a. Runoff and erosion potential
 - b. Proximity to surface water
 - c. Crop production and cultural practices
5. Identify risks associated with contaminant movement from stored and stacked manure.
6. Recognize odor and nuisance risk associated with land application of manure and appropriate practices for limiting those risks.

Pest Management

Competency Area 1: Basic Concepts in Weed Biology

- List the life cycle of the weeds listed.

<u>Weed List:</u> Redroot pigweed Common sunflower Common lambsquarter Green foxtail Barnyardgrass Large crabgrass Common waterhemp	Tansy mustard Field pennycress Henbit Downy brome Cheat Jointed goatgrass Marestail/Horseweed	Musk thistle Plumeless thistle Canada thistle Field bindweed Common milkweed Hemp dogbane Palmer Amaranth
--	---	---

- List the method(s) of reproduction (seed or vegetative) of the weeds listed.

<u>Weed List:</u> Redroot pigweed Common sunflower Common lambsquarter Green foxtail Barnyardgrass Large crabgrass	Tansy mustard Field pennycress Henbit Downy brome Cheat Jointed goatgrass	Musk thistle Plumeless thistle Canada thistle Field bindweed Common milkweed Hemp dogbane
--	--	--

- List the relative weed competitiveness of corn, grain sorghum, soybean, and sugarbeet.
- List the relative competitiveness of foxtail, velvetleaf, sunflower, redroot pigweed, lambsquarters, and sandbur.
- Describe the critical weed free period as it relates to weed management.

Competency Area 2: Basic Concepts of Herbicides

- Classify the following postemergence herbicides as contact or translocated:

Accent Basagran Resource Gramoxone	Beacon Pursuit Buctril Liberty	Aim 2,4-D Ally Roundup	Banvel Starane Cadet Callisto
---	---	---------------------------------	--

- Classify the following herbicides based on site of action:

Select Poast Pursuit Treflan/Prowl Valor	Ally Accent Beacon Balance	Roundup Glyphosate Liberty Authority/Spartan	Atrazine Sencor Buctril Classic
--	-------------------------------------	---	--

- Describe the impact of soil texture and organic matter on efficacy of soil applied herbicides.
- Describe the impact of soil texture and organic matter on herbicide leaching.

Competency Area 3: Herbicide Resistant Crop Concepts

1. Understand the weed management implications of Roundup Ready, Clearfield, Liberty Link, RR2 Xtend, Enlist and STS crop hybrids/varieties.

Competency Area 4: Basic Concepts of Integrated Management of Insects and Mites

1. Diagnose for each of the following insects and mites each of their associated crop injury symptoms, and understand each of their life cycles.

<p><u>Corn</u> Armyworm Corn leaf aphid Corn rootworms Cutworms European corn borer Fall armyworm Flea beetles Grasshoppers Seed corn beetles Seed corn maggot Stalk borer Spider mites White grubs Wireworms Western Bean Cutworms</p> <p><u>Sugar Beet</u> Sugarbeet root maggot Sugarbeet root aphid</p>	<p><u>Soybean</u> Grasshoppers Green cloverworm Potato leafhopper Seed corn maggot Spider mites Thistle caterpillar Thrips Woolly bears Japanese Beetles</p> <p><u>Wheat</u> Russian wheat aphid Greenbug Chinch bug Hessian fly Armyworm Army cutworm Wheat curl mite</p>	<p><u>Alfalfa</u> Cloverleaf weevil Aphids Blister beetles Plant bugs Potato leafhopper Grasshoppers Alfalfa weevil</p> <p><u>Grain Sorghum</u> Greenbug Chinch bug Corn leaf aphid</p> <p><u>Dry Bean</u> Mexican bean beetle Western bean cutworm</p>
--	--	--

2. Identify common predators and parasitoids, and their potential impact on pest insects:

Lady beetles	Parasitic wasps	Ground beetles
Lacewing	Damsel bug	Minute pirate bug
Predatory mites		

3. Recognize the fundamental definitions of economic threshold and economic injury level and how they are used in decision-making for insect control.
4. Recognize how cropping sequence or crop rotation influences the potential for occurrence of insect pests in crops.
5. Recognize the influence of the following cropping practices on insects:
 - a. Early or late planting
 - b. Early or late harvest
 - c. Tillage
 - d. Weed control

6. Identify the primary management strategies for the following key insect problems:
- a. Corn rootworms in corn
 - b. Cutworms in corn
 - c. European corn borer in corn
 - d. Bean leaf beetles in soybean
 - e. Grasshoppers in corn and soybeans
 - f. Spider mites in corn and soybean
 - g. Alfalfa weevils in alfalfa
 - h. Potato leafhoppers in alfalfa
 - i. Chinch bugs in sorghum and wheat
 - j. Greenbugs in sorghum and wheat
 - k. Russian wheat aphid in wheat
 - l. Wheat curl mite in wheat
 - m. Hessian fly in wheat
 - n. Army cutworms in wheat
 - o. Mexican bean beetle in dry bean
 - p. Sugarbeet root maggot in sugar beet

Competency Area 5: Basic Concepts in Plant Disease Biology

1. Define the concept of disease in plants.
2. Recognize the types of plant diseases.
3. Relate disease development with environmental and cultural factors.
4. Recognize host range of plant pathogens.

Competency Area 6: Basic Concepts Involving Signs and Symptoms of Plant Disease

1. Identify key symptoms of commonly occurring diseases of field crops.

<p><u>Corn</u> Gray leaf spot Eye spot Anthracnose Stalk rots Nematode injury Maize chlorotic mottle Maize dwarf mottle Common rust Goss's wilt Stewart's wilt Southern rust</p> <p><u>Wheat</u> Leaf rust Tan spot Wheat streak mosaic Soil-borne wheat mosaic Crown and root rot Stripe rust Powdery mildew Ergot</p>	<p><u>Soybean</u> Sclerotinia stem rot Phytophthora root rot Cyst nematode Seedling blight Brown stem rot Charcoal rot Pod and stem blight Brown spot Soybean rust Downy mildew Bean pod mottle White mold Pythium damping off SDS (Sudden Death Syndrome)</p> <p><u>Sugar Beet</u> Cyst nematode Rhizomania Rhizoctonia crown rot Cercospora leaf spot Aphanomyces root rot</p>	<p><u>Alfalfa</u> Anthracnose Phytophthora root rot Spring black stem Summer black stem Common leaf spot Downy mildew</p> <p><u>Grain Sorghum</u> Bacterial leaf stripe Sooty stripe Downy mildew Zonate leaf stripe Ergot</p> <p><u>Dry Edible Beans</u> White mold Common blight Halo blight Rust Bacterial wilt Fusarium root rot</p>
--	---	--

Competency Area 7: Basic Concepts in Control and Management of Plant Diseases

1. Describe the primary management strategy for the following key field crop diseases:
- a. Gray leaf spot of corn
 - b. Stalk rot diseases of corn
 - c. Corn virus diseases such as maize chlorotic mottle
 - d. Sclerotinia stem rot/ White Mold in Soybeans
 - e. Soybean cyst nematode
 - f. Soybean seedling blight diseases
 - g. Wheat leaf rust
 - h. Wheat Stripe Rust
 - i. Crown and root rots of wheat
 - j. Anthracnose of alfalfa
 - k. Spring black stem of alfalfa
 - l. Phytophthora root rot of alfalfa
 - m. Rust of dry edible beans
 - n. Rhizomania disease of sugarbeet
 - o. Soybean rust
 - p. Corn grain molds
 - q. Goss's Wilt management in corn
 - r. SDS (Sudden Death Syndrome) in soybeans

Competency Area 8: Concepts in Calibration of Pesticide Application Equipment

1. Identify the relative qualities of the following nozzle tip materials:
 - a. plastic
 - b. stainless steel
 - c. ceramic
 - d. brass
 - e. harden stainless steel
2. Describe the pattern, relative droplet size, pattern overlap, and primary uses of the following nozzles types:
 - a. flat fan
 - b. even flat fan
 - c. hollow cone
 - d. flooding tip
 - e. venturi tip
 - f. Turbo T-Jet
 - g. Turbo Drop
 - h. TTI Low Drift
3. Know the information required to select and size a nozzle that will achieve a given application rate.
4. Calculate nozzle selection for a given target carrier amount x nozzle type x target application speed.
5. Identify and describe characteristics of the following pumps:
 - a. diaphragm
 - b. roller
 - c. centrifugal
 - d. piston
6. Know how the following factors affect spray delivery, coverage and potential drift:
 - a. nozzle pressure
 - b. sprayer speed
 - c. nozzle type
 - d. nozzle spacing
 - e. nozzle height
 - f. weather condition
 - g. wind speed
 - h. nozzle configuration

7. Identify the function of the following sprayer plumbing components:
 - a. throttling valve
 - b. tank shut-off
 - c. by-pass line
 - d. pressure relief valve
 - e. agitator
 - f. regulating valve
 - g. line strainer
 - h. anti-drip bodies
8. Calculate the amount of chemical required to create a specific tank solution.
9. Understand the factors of calibration and the “ounce calibration” method:
 - a. spray width
 - b. travel speed
 - c. nozzle discharge (gpm)
10. Identify the maximum acceptable variance among nozzles on a spray boom.
11. Know chemigation calibration principles.
12. Identify the chemigation equipment needed to prevent groundwater contamination.
13. Know the effect of climatic conditions, pesticide formulation and properties and additives on spray drift and volatilization.
14. Know the Nebraska rules and regulations concerning pesticide and fertilizer storage.
15. Describe preferred nozzle type, spray droplet size, and carrier volumes for application to the following:
 - a. Pre-Herbicide
 - b. Burndown Herbicide Application with Liquid Fertilizer
 - c. Post Herbicide Application
 - d. Foliar Fungicide/Insecticide Application
16. Describe preferred adjuvant for the following application conditions:
 - a. Pre-Herbicide
 - b. Burndown Herbicide Application with Liquid Fertilizer
 - c. Post Herbicide Application
 - d. Foliar Fungicide/Insecticide Application

Competency Area 9: Concepts of Resistance Management (Weeds, Insects, Diseases)

1. Define resistance for weeds, insects, and diseases.
2. Understand primary causes of development of resistance.
3. Define “Effective Modes of Action” when selecting herbicide combinations.
4. Understand pest management strategies that increase the risks of development resistance.
5. Define Management Strategies that reduce the risk of resistance development in row crops, perennial crops, pastures, ecofallow, and non-crop areas.

6. Understand how to identify factors that help in diagnosing potential resistance species within a given field environment. Know the signs of resistance development.
7. Define Mode of Action and Site of Action.
8. Understand risk of cross resistance.
9. Define Target Site Resistance and Metabolic Resistance in a weed population. Know an example of each.
10. Understand multiplicity of resistance to multiple Site of Action.
11. List Management Strategies to reduce the risk or reduce further development of the following pests:

<u>Weeds</u>	<u>Diseases</u>	<u>Insects</u>
Palmer Amaranth in row crops	Frogeye in Soybeans	Corn Rootworm Larva
Waterhemp in row crops	Early Blight in Potatoes	Corn Rootworm Beetles
Marestail in row crops	Cyst Nematode Traits	Corn Rootworm Traits
Ragweeds in row crops	Soil-borne pathogens	Foliar CRW Beetle Options
Kochia in row crops, fallow, dry beans	Foliar pathogens	
Shattercane in corn or milo		
Sunflowers in sunflower rotations (ALS Traits)		

Crop Management

Competency Area 1: Basic Concepts in Crop Adaptation

1. Describe the influence of temperature and precipitation on cropping systems options.
2. Describe the influence of day length and climate on hybrid and cultivar selection, and crop adaptation.
3. List the minimum, optimum, and maximum temperatures for seed germination and growth for corn, soybean, wheat, grain sorghum, and alfalfa.
4. Describe the consequences of temperature and precipitation extremes on crop growth and crop quality.

Competency Area 2: Basic Concepts of Crop growth and Development

1. Describe the important growth stages for soybean, corn, grain sorghum, wheat, and alfalfa.
 - a. emergence
 - b. vegetative stages
 - c. floral initiation
 - d. flowering
 - e. grain or seed development
 - f. maturity
2. Describe changes in water requirements during growth and development and which stages are most sensitive to stress.
3. Relate crop growth stage to appropriate crop management practices for soybean, corn, grain sorghum, and wheat.
4. Relate the growing degree day (GDD) concept to crop development, recognize its function in production systems, and calculate GDD for corn, grain sorghum and wheat.
5. Define physiological maturity and harvest maturity in grain and seed crops.
6. Compare and contrast rooting patterns of corn, grain sorghum, winter wheat, alfalfa, soybean, field bean, and sugarbeet plants.
7. Discuss water use requirement differences for corn, wheat, grain sorghum, alfalfa, field bean, and soybean.
8. List the yield components for corn, grain sorghum, soybean, and wheat.

Competency Area 3: Basic Concepts in Crop damage, Mortality, and Replant Decisions

1. Identify damage to agronomic crops from hail, frost, drought, wind, flooding, herbicide injury, and insect defoliation.
2. Understand the consequences of this damage to plant growth and crop yield and the relationship between amount of crop damage and stage of development.

3. Recognize weather and plant factors that influence the plant's ability to resume growth after injury has occurred.
4. Assess crop damage and determine if replanting is necessary.

Competency Area 4: Basic Concepts of Cultivar and Hybrid Selection

1. Describe the differences between hybrids and cultivars and how these differences influence management decisions.
2. List the characteristics important for selecting hybrids and cultivars.
3. Describe the basic concepts required for significance in yield test reports such as least significant difference (LSD) and T-square.

Competency Area 5: Basic Concepts of Seeds and Seeding

1. List those traits used to determine seed quality.
2. Calculate the data from a seed analysis when given:
 - a. purity
 - b. percent germination
 - c. percent weed seeds
 - d. percent inert matter
 - e. percent other crop seeds
 - f. pure-live seed percentage
3. Calculate the seeding rate in seeds per acre, or seeds per foot of row, adjusted for pure-live seed percentage, when given the seeds per pound, row spacing, desired seeding rate, and expected field emergence.
4. Describe the impacts of crop canopy, residue cover and tillage system on weed pressure and control strategies.
5. Discuss the effects of seed size, shape and color on planting, germination, and emergence and stand establishment.
6. List the three steps in the seed germination process and the environmental conditions necessary for each step.
7. Define seed dormancy, list the causes and the crops in which it most commonly occurs and the techniques used to correct seed dormancy.
8. Explain how dormancy affects weeds differently than crops.
9. Describe seed fungicide and insecticide treatments, indicate the crops on which they are most commonly used and why, and discuss the cost/benefits.
10. List and describe the germination tests used to estimate field emergence and the relative value of each test.

11. List and explain the factors that determine planting date, planting depth, planting method and planting rate of:

alfalfa corn field beans	millet sorghum (forage & grain) soybeans	spring small grains sunflowers wheat
--------------------------------	--	--

12. List the advantages and disadvantages of early and late planting of:

alfalfa corn	sorghum soybeans	spring small grains wheat
-----------------	---------------------	------------------------------

13. Describe the difference between seeding rate and plant population at emergence, and list the factors that affect seedling survival.

Competency Area 6: Basic Concepts in Cropping Systems

1. List the advantages and disadvantages of crop rotations versus a single crop system.
2. Understand Crop Functional Groups
 - a. Warm season grasses
 - b. Warm season broadleaves
 - c. Cool season broadleaves
 - d. Cool season grasses
3. Describe possible and most likely crop rotations or single crop systems for the following areas, and indicate the economic and environmental factors which impact crop rotations in each area:
 - a. East of Highway 81
 - b. Highway 81 to Panhandle
 - c. Panhandle
 - d. Eastern Nebraska-rainfed and irrigated
 - e. Central Nebraska-rainfed and irrigated
 - f. Western Nebraska-rainfed and irrigated
 - g. Sandhills-irrigated
4. Describe the following cropping systems and indicate where in Nebraska each system is most likely to be used:
 - a. Continuous cropping: Corn & Soybean
 - b. Double cropping
 - c. Strip cropping
 - d. Ecofallow
 - e. Wheat fallow
 - f. Pulse Crops
 - g. Specialty Cropping
 - h. Continuous cropping in traditional fallow areas
 - i. Rotational Cropping

5. Describe the following tillage systems and indicate the advantages and disadvantages of each system for row or close seeded (drilled) crops:
 - a. Clean tillage
 - b. Ridge till
 - c. Conventional tillage
 - d. No till
 - e. Strip Till
 - f. Continuous No Till
6. Distinguish among sustainable, non-sustainable, and organic cropping systems.
7. Characterize the following precision agriculture terms:
 - a. Geographic Information Systems (GIS)
 - b. Global Positioning Systems (GPS)
 - c. Site-Specific Management
 - d. Grid Soil Sampling
 - e. Zone Soil Sampling
 - f. Variable Rate Technology (VRT)
 - g. Yield Mapping
8. List the advantages and/or disadvantages of GIS/GPS in a cropping system.
9. List the opportunities and limitations of GIS/GPS in a cropping system.

Competency Area 7: Basic Concepts Crop Production Economics

1. Calculate profit/acre given yields, prices, and input costs.
2. Describe the concepts of profit maximization and optimum input.

Competency Area 8: Refer to UNL Basic Crop Budgeting NebGuide

1. Understand basic crop budgeting procedures as described in the UNL Crop Budgeting NebGuide.

Competency Area 9: Basic Concepts for Cover Crops/Pulse Crops

1. Understand basic concepts associated with cover crops.
2. Understand basic concepts associated with pulse crops.
